QlikView Enterprise Framework by fme

Our customers all agree – the customary method of standard reporting needs to be replaced with a modern and flexible 'analysis' solution. From an IT point of view, the prerequisites are nearly there. Modern ERP and CRM solutions and central databases provide a high volume of information. Unfortunately, the information is made available using standard reports only. Under this system it is nearly impossible to produce flexible analyses and leverage the associated quicker reaction times to new market situations or insights. The QlikView Enterprise Framework by fme represents a fresh approach, locating potential for optimization and making the information available to departments in a targeted manner. Expertise derived from many different projects has been combined with the modern and flexible QlikView BI product to provide a high-quality solution. Even the first project utilizing the fme framework can cut costs in half when producing documentation or creating an app.

Are you looking to get started with QlikView without needing to make a big investment? Or would you like to improve your business intelligence environment with controlled self-service BI for quicker and more flexible decision-making?
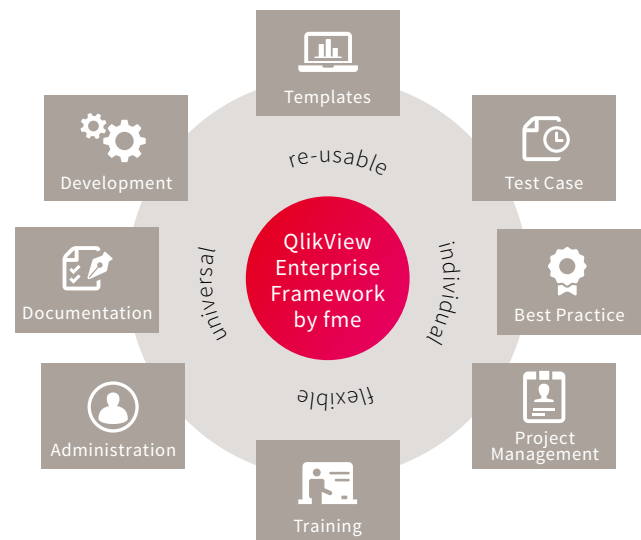

QlikView allows you to create meaningful analyses delivering well-grounded results with flexibility and speed. But it is precisely QlikView's speed and ease of use that often causes the structuring of QlikView environments to be neglected. This can result in frequent duplication of BI analyses, isolated applications, and neglected or missing documentation. In the end you may find yourself back at square one, asking basic questions:

- How do I build up a fast, clear, structured, standardized, and therefore re-usable QlikView environment?

- What should I keep in mind in order to use QlikView successfully and efficiently even after an interval of several months?

Companies with business activities and locations spread across the globe, in particular, are often faced with the challenge of deploying QlikView across the organization in an efficient and controlled manner without losing the benefits of flexibility and self-service. How to strengthen and expand these advantages? Our QlikView Enterprise Framework by fme now makes it possible.

Solution

The QlikView Enterprise Framework by fme offers a universal package tailored to your individual requirements and ready to go immediately. The framework was developed in-house and draws on your data directly in order to prepare it for analysis in ready-made QlikView templates. We are also available

to support your project right from the beginning – from the initial idea to its conclusion, including documentation, administration, and associated training activities.
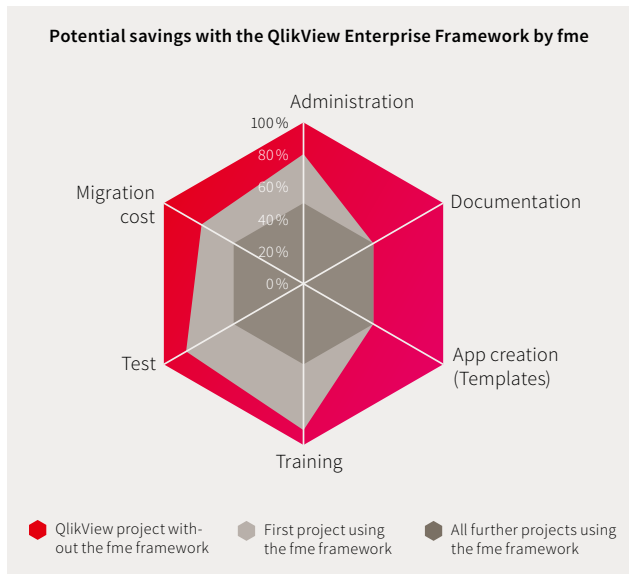

The framework enables you to not only smoothly roll out QlikView, but also to integrate it into an existing QlikView environment, for example, to increase the maturity of self-service BI or establish a data governance model.

You will benefit both from shorter introduction and project times and from simplified administration, maintenance, and development thanks to our detailed and practical manuals. Additionally, our best practices collection provides valuable hints from projects already concluded successfully.

You can get started in QlikView without much effort!

Our Offer

We will provide you with a finished, solution-oriented, and comprehensive QlikView package that will meet the majority of your needs from the start and require only minor user-specific tweaks. This package includes templates, practical administration manuals, documentation, and many valuable best practice hints drawn from numerous international projects in the production, sales, and quality management sectors.
